

Problem-Solution Fit

Date	04 July 2026
Team ID	XXXXXX
Project Name	Credit Card Approval Prediction
Maximum Marks	5 Marks

Problem-Solution Fit Canvas:

This Problem-Solution Fit Canvas serves as a strategic validation framework to align our machine learning-driven Credit Card Approval Framework with the operational demands and technical limitations of banking environments. By analyzing customer segments alongside active operational bottlenecks, this canvas ensures that our deployment of predictive classification models directly solves the structural root causes of underwriting delays and processing fatigue rather than merely addressing surface symptoms.

1. CUSTOMER SEGMENT(S) [CS] Our framework directly serves retail banks, commercial credit card issuers, and internal underwriting operations teams while providing rapid automated feedback to digital end-user applicants.	6. CUSTOMER LIMITATIONS EG. BUDGET, DEVICES [CL] Lenders are restricted by legacy software that limits web API integrations, strict regulatory laws requiring completely explainable AI, and high rates of missing or sparse credit histories.	5. AVAILABLE SOLUTIONS PROS & CONS [AS] Traditional rule engines offer clear compliance but lack flexible risk logic, whereas manual underwriters handle unique edge cases effectively but remain slow, expensive, and completely unscalable.
2. PROBLEMS / PAINS + ITS FREQUENCY [PR] Underwriting teams face massive document bottlenecks daily, while subjective evaluations create inconsistent approval standards and high application dropouts due to long processing queues.	9. PROBLEM ROOT / CAUSE [RC] The core issues are an absence of real-time automated data integration pipelines across financial bureaus and the technological inability of standard platforms to model complex, multi-variable interactions simultaneously.	7. BEHAVIOR + ITS INTENSITY [BE] Severe application backlogs during seasonal retail surges force intensive employee overtime, which pressures officers to run rapid shortcut checklists that compromise deep risk auditing.

3. TRIGGERS TO ACT [TR]

Severe processing overheads during volume spikes, rising customer churn to automated FinTech apps, and regulatory audit warnings regarding subjective underwriting biases force immediate modern system modernization.

4. EMOTIONS

BEFORE / AFTER [EM]

Before using the solution, staff feel backlog-stressed and applicants feel anxious due to dark processing delays; after deployment, operations gain total confidence and users experience high satisfaction.

10. YOUR SOLUTION [SL]

An automated machine learning framework deploying classification algorithms to instantly predict credit applicant creditworthiness. It parses risk attributes in real time, securely optimizes screening speed, and issues automated risk confidence scores to bypass manual validation bottlenecks.

8. CHANNELS OF BEHAVIOR [CH]

Operations run online through web portals, automated data networks, and central risk dashboards, supplemented offline by local physical bank branches and manual paper verification desks.
